

Data Praktikan

Nama	Ariski Myardi
NIM	1103220019
Hari/Shift	Selasa/4
Kelompok	19

Soal Teori

1. Jelaskan apa itu CRUD!
2. Sebutkan library yang digunakan untuk melakukan CRUD MySQL pada python!
3. Tuliskan Query untuk membuat tabel mahasiswa dengan attribute nama, nim dan kelas pada database!
4. Tuliskan masing-masing syntax untuk melakukan CRUD MySQL pada Python!

Soal Praktik

A. NIM Genap

Buat sebuah program bebas menggunakan Bahasa Python yang dapat melakukan **Create** dan **Delete**

NB : data yang digunakan menggunakan data Kalian dan Teman kalian (Nama & NIM)

B. NIM Ganjil

Buat sebuah program bebas menggunakan Bahasa Python yang dapat melakukan **Read** dan **Update**

NB : data yang digunakan menggunakan data Kalian dan Teman kalian (Nama & NIM)

Note:

- Sertakan Query ketika membuat tabel (Contoh : INSERT INTO, atau CREATE DATABASE...)

Jawaban Soal Teori:

1. CRUD adalah singkatan yang berasal dari Create, Read, Update, dan Delete, dimana keempat istilah tersebut merupakan perintah utama yang nantinya diimplementasikan ke dalam basis data.
2. `import mysql.connector`
- 3.

```
import mysql.connector

db =mysql.connector.connect(
    host = "localhost",
    user = "root",
    password = "",
    database = "seantuy"
)

real = db.cursor()
table_content = '''CREATE TABLE data_mahasiswa (
    no_mhs INT AUTO_INCREMENT PRIMARY KEY,
    nama VARCHAR(255),
    nim VARCHAR(255),
    kelas VARCHAR(255)
)'''
real.execute(table_content)
print("Table Created")
```

4.

```
#create
import mysql.connector

db =mysql.connector.connect(
    host = "localhost",
    user = "root",
    password = "",
    database = "seantuy"
)
```

```
real = db.cursor()
table_content = '''CREATE TABLE data_mahasiswa (
    no_mhs INT AUTO_INCREMENT PRIMARY KEY,
    nama VARCHAR(255),
    nim VARCHAR(255),
    kelas VARCHAR(255)
)'''
real.execute(table_content)
print("Table Created")
```

```
# read
import mysql.connector

db =mysql.connector.connect(
    host = "localhost",
    user = "root",
    password = "",
    database = "seantuy"
)

real = db.cursor()
real.execute("SELECT * FROM data_mahasiswa")

data = real.fetchall()

for x in data:
    print(x)
```

```
# update
import mysql.connector

db =mysql.connector.connect(
    host = "localhost",
```

```
    user = "root",
    password = "",
    database = "seantuy"
)

real = db.cursor()

ubah = "UPDATE data_mahasiswa SET nama = %s, nim = %s, kelas = %s
WHERE nama = %s"
data_ubah = ("Daffa", "110322190", "TK4607", "Yusuf")
real.execute(ubah, data_ubah)

db.commit()

real.execute("SELECT * FROM data_mahasiswa")
data = real.fetchall()

for x in data:
    print(x)
```

```
#delete
import mysql.connector

db =mysql.connector.connect(
    host = "localhost",
    user = "root",
    password = "",
    database = "seantuy"
)

real = db.cursor()

data_delete = "DELETE FROM data_mahasiswa WHERE no_mhs = %s"
val = (2,)
```

```
real.execute(data_delete, val)

db.commit()

real.execute("SELECT * FROM data_mahasiswa")
data = real.fetchall()

for x in data:
    print(x)
```

Query ketika membuat tabel soal praktik:

```
import mysql.connector

db = mysql.connector.connect (
    host = "localhost",
    user = "root",
    password = "",
    database = "seantuy"
)
real = db.cursor()
table_content = '''CREATE TABLE nama_mhs (
    no_teman INT AUTO_INCREMENT PRIMARY KEY,
    nama VARCHAR(255),
    nim VARCHAR(255)
)
'''
real.execute(table_content)
print("Table Created")
```

Source code soal praktik:

```
#read
import mysql.connector

db = mysql.connector.connect (
    host = "localhost",
    user = "root",
    password = "",
    database = "seantuy"
)
real = db.cursor()

real.execute("SELECT * FROM nama_mhs")

data = real.fetchall()

for x in data:
    print(x)

#update
# update
import mysql.connector

db =mysql.connector.connect(
    host = "localhost",
    user = "root",
    password = "",
    database = "seantuy"
)

real = db.cursor()

ubah = "UPDATE nama_mhs SET nama = %s, nim = %s WHERE nama = %s"

input_nama_yg_mau_diubah = input("input nama baru: ")
```

```
input_nim_yg_mau_dibuah = input("input nim baru: ")
data_ganti = input("Masukkan Data yang ingin diubah: ")
data_ubah = (input_nama_yg_mau_diubah, input_nim_yg_mau_dibuah,
data_ganti)
real.execute(ubah, data_ubah)

db.commit()

real.execute("SELECT * FROM nama_mhs")
data = real.fetchall()

for x in data:
    print(x)
```

Screenshot hasil run program:

READ

```
(1, 'Kimi', '1103220019')  
(2, 'Cahyo', '1103223043')
```

UPDATE

```
(1, 'Agus', '1103221203')  
(2, 'Cahyo', '1103223043')
```

Bukti screenshot menonton video:

The screenshot shows a YouTube video player with the video titled "Materi Modul 5 - Koneksi Database MySQL | Praktikum Pemrograman Berbasis Objek" by SEA Laboratory. The video content displays a Python script in a Jupyter Notebook environment. The script prompts the user to enter a table name and confirms the deletion of the database. The code is as follows:

```
File Edit View Run Kernel Tabs Settings Help
modul5.ipynb
Masukkan nama tabel: asisten_lab
Apakah kamu benar benar ingin menghapus asisten_lab (y/n) y
Tabel berhasil Terhapus!

Menghapus Database (Delete)

[14]: db = mysql.connector.connect(
      host = "localhost",
      user = "root",
      password = ""
    )
    real = db.cursor()
    nama_db = input("Masukkan nama database: ")
    jawaban = input("Apakah kamu benar benar ingin menghapus (nama_db) (y/n)")
    if ( jawaban == "y" or jawaban == "Y" ) :
        real.execute(f"DROP DATABASE (nama_db)")
        print("Database berhasil Terhapus!")
    else :
        print("Oke menjadi")

Masukkan nama database: seantuy
Apakah kamu benar benar ingin menghapus seantuy (y/n) y
Database berhasil Terhapus!

[ ]:
```

The video player interface includes a search bar with "sea laboratory", a video progress bar at 18:50 / 19:10, and a channel subscription button for SEA Laboratory (70 subscribers). The Windows taskbar at the bottom shows the system time as 01:30 on 26/11/2023.
