

DREAM JOB

REMOTE SOFTWARE ENGINEERING

01

K (WHAT I KNOW)

1. Software development requires continuous learning of new languages/frameworks (e.g., JavaScript, Python).
2. Remote work provides flexibility but demands strong self-discipline and time management.
3. Indonesian work culture emphasizes collective harmony (rukun) and avoiding direct conflict.
4. The Indonesian tech ecosystem is growing fast, with many local unicorn startups (like GoTo, Bukalapak).

02

W (WHAT I WANT TO KNOW)

1. What are the most effective strategies for a remote team to apply gotong royong (mutual cooperation) to code review and debugging?
2. What are the key legal or tax considerations for a full-time Indonesian remote developer working for a foreign company?
3. How do highly hierarchical companies in Indonesia (often respecting seniority) integrate flat, modern tech practices like agile/Scrum?
4. What are the most in-demand technical skills (frameworks or languages) for remote work in the Indonesian FinTech and e-commerce sectors right now?

03

L (WHAT I LEARNED)

1. Effective strategies for remote gotong royong include structured pair programming sessions and dedicated "Swat Team" rotations to collectively tackle urgent bugs.
2. Key considerations include the need to register as a taxpayer (NPWP) and potential requirements for income tax (PPh 21), depending on the contract type (employee or independent contractor).
3. Modern tech companies often use Paternalistic Leadership where managers act as guiding figures, blending respect for hierarchy with the flexibility needed for agile practices.
4. Currently high-demand skills are typically Full-Stack JavaScript (Node.js/React), Go (for scalability), and mobile development (Flutter/Kotlin/Swift).
