Reading Log

Component	Entry
Entry #	R011
Date	December 18, 2025
Title	Blockchain-Based Security Framework for Internet of Things Networks
Source / Website	IEEE Access / MDPI (2023)
Text Type	Research Article / Cybersecurity
Text Level	B2+
Topic / Theme	Blockchain, IoT Security, Smart Contracts
Length (In Page)	14 pages
Difficulty (1–5)	4/5
New Vocabulary	Decentralization, Smart Contract, Consensus Algorithm, Ledger
Key Career Insights	Understanding decentralized security is vital for protecting large-scale IoT networks from centralized points of failure.
Recommendation	★★★★☆

Component	Entry
Entry #	R012
Date	December 22, 2025
Title	Machine Learning for DDoS Attack Detection in Software-Defined Networks
Source / Website	Robotics and Autonomous Systems Journal (2024)
Text Type	Research Article / Artificial Intelligence
Text Level	C1
Topic / Theme	Reinforcement Learning, Autonomous Robots, Navigation
Length (In Page)	16 pages
Difficulty (1–5)	5/5
New Vocabulary	Reinforcement Learning, Reward Function, Markov Decision Process, Policy Gradient
Key Career Insights	Mastery of reinforcement learning allows engineers to create robots that can learn and adapt to dynamic environments independently.
Recommendation	★★★★★

Reading–Writing Journal

RWJ Entry 11

B2+ Level (Week 6 of 8)

Writing Prompt Response: “Securing the Future of IoT”

Entry: 6/8 – Week 6

My Journal Entry:

In Entry R011, I read about the integration of blockchain technology to enhance the security of Internet of Things (IoT) ecosystems. The research explores how decentralized ledgers can prevent single points of failure that are common in traditional centralized networks. I learned about smart contracts and how they can automate security protocols between devices without human intervention. This reading is highly relevant because as more devices become connected, finding secure and scalable solutions is a priority for computer engineers. Understanding these cryptographic methods helps me realize the potential of blockchain beyond just digital currency, especially in creating a transparent and tamper-proof environment for sensitive data transmission.

RWJ Entry 12

C1 Level (Week 6 of 8)

Writing Prompt Response: “Advanced Intelligence in Robotics”

Entry: 6/8 – Week 6

My Journal Entry:

Entry R012 discusses the implementation of Deep Reinforcement Learning for the navigation of autonomous mobile robots. The article explains how a robot can learn to navigate complex environments by receiving rewards for positive actions and penalties for collisions. I found the explanation of policy gradients and the Markov Decision Process very insightful for understanding how artificial intelligence mimics human trial-and-error learning. This study is directly applicable to my interest in robotics and autonomous systems. It highlights the shift from hard-coded algorithms to self-learning models, which is essential for developing robots that can adapt to unpredictable real-world scenarios such as busy city streets or dynamic workplaces.
